DETAILED ACTION

In view of the Appeal Brief filed on 7/28/05, PROSECUTION IS HEREBY REOPENED. A new ground(s) of rejection set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

(1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,

(2) initiate a new appeal by filing a notice of appeal under 37 CFR 41.31. A new notice of appeal fee and appeal brief fee will not be required for applicant to appeal from the new Office action. Any appeal brief filed on or after September 13, 2004 must comply with 37 CFR 41.37.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1, 3, and 82 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 5,368,392 to Hollander et al [hereinafter Hollander] in view of U.S. Patent 4,948,258 to Caimi.

Hollander discloses a device for temperature measurement comprising:

Art Unit: 2859

a radiometer having a detector and an optical system for imaging the heat radiation emanating from a measurement spot onto the detector, and

a sighting arrangement having a laser aligned to illuminate an optical element (30) to produce a light pattern that identifies and outlines the position and size of the measurement spot by means of visible light;

wherein the optical element generates a circular arrangement of more than two beams to outline and identify the energy zone.

The laser illuminates the optical element as a motor rotates the optical element in order to form the circular pattern on the surface.

Hollander does not disclose the optical element of the sighting arrangement being a diffractive optical system formed by a holographic element.

Caimi discloses a diffractive optical system formed by a holographic element (8). The holographic element is illuminated by a laser beam to split the laser beam into a plurality of divergent laser spots to form a predetermined pattern of spots on a surface and mark a location on the surface (see column 1, lines 19-36; column 3, lines 40-59; column 4, lines 50-64).

Referring to claim 1, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the sighting arrangement disclosed by Hollander by replacing the optical element and motor of the sighting arrangement with a holographic element, as taught by Caimi, to form a circular pattern in order to simplify the sighting arrangement by reducing the number of individual working parts.
